

COMPLEX COORDINATIVE COMPOUNDS

Donor :→ □ acceptor bonds form coordinative, complex compounds.

Complex compounds comprise square brackets [complex] and designate about complex ion, inner sphere.

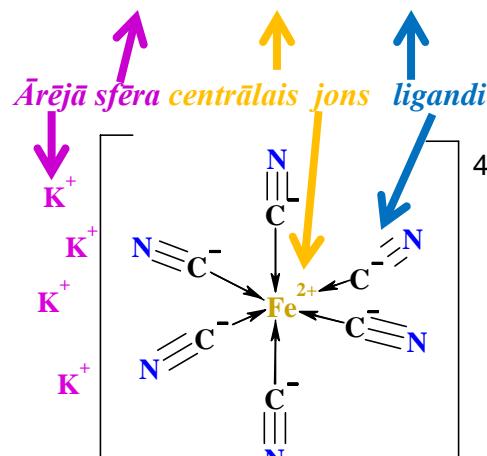

[Complex ion (inner sphere)]

As hexa ciano ferrate(II) Fe^{2+} and tetra amino copper(II) sulfate

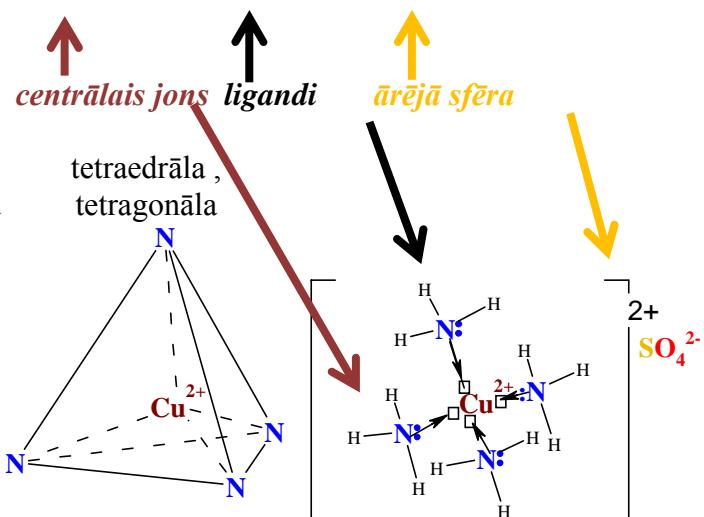

donor $\text{N}\equiv\text{C}^- \rightarrow \square \text{Fe}^{2+} \square \leftarrow \text{:C}\equiv\text{N}$ donor ; donor $\text{H}_3\text{N}^- \rightarrow \square \text{Cu}^{2+} \square \leftarrow \text{:NH}_3$ donor

[Complex ion (inner sphere)]

$\text{K}_4 [\text{Fe}(\text{CN})_6]$

$[\text{Cu}(\text{NH}_3)_4] \text{SO}_4^{2-}$

Central ion, acceptor is cation of metallic element atom. Have empty electron orbitals □ for accepting.

Ligands – particles connected by donor acceptor bonds: → □ to central ion in symmetrical geometry

Outer sphere – ions that compensate the opposite charge of complex ion as electrolyte

Complexes forms

central symmetric geometric structures figure:

1. Octahedral, hexagonal, bipyramidal figure;
2. Tetrahedral, tetragonal, trigonal pyramid;
3. Trigonal planar triangular figures;
4. Linear, stick shape structure.

Central ion as complex maker –

around **metal ion** in symmetric geometry
ligands form complex compound **inner sphere**,
designated **complex ion**.

Complex compound stability make chemical bonds strength of ligands free electrons pair donor: .

Central ion bound **coordinated account of ligands** called about **coordination number**.

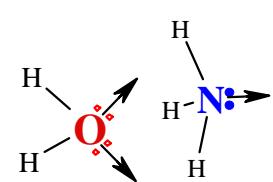

Electron pair donors in ligands are atoms with free unshared electron pairs like atoms:

Human organism ligand atoms are two valent oxygen $\text{:O}:$ and

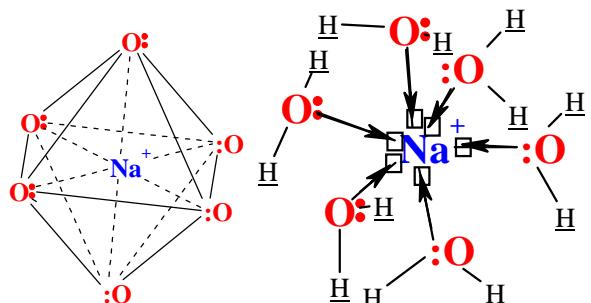

tree valent nitrogen $\equiv\text{N}:$.

For example, water molecule H_2O and ammoniac molecule H_3N^+ :

Coordination number calculates **dubling central ion charge :**

Central ions	Central ion charge	Ligand number
Ag^+	+1	2
$\text{Zn}^{2+}, \text{Cu}^{2+}, \text{Pb}^{2+}, \text{Ni}^{2+}$	+2	4
$\text{Al}^{3+}, \text{Cr}^{3+}, \text{Fe}^{3+}$	+3	6
Li^+	+1	4
Na^+, K^+	+1	6
$\text{Mg}^{2+}, \text{Ca}^{2+}, \text{Fe}^{2+}, \text{Co}^{2+}$	+2	6

Ascending coordination complex compounds stability for five type ligands

1. **Aqua** complexes are metal ions Na^+ , K^+ , Mg^{2+} , Ca^{2+} , Fe^{2+} , Co^{2+} in water solution, which coordinate water ligand molecules at hexagonal central symmetry $[\text{Na}^+(\text{H}_2\text{O})_6]$ with coordination number 6. Ligands are electrons donors $\text{H}_2\text{O}:\rightarrow\square$. Aqua complexes are weaker as other ligands coordinative compounds, which push out from coordination sphere water molecules by stronger donor acceptor bonds.

Central ions are metal element atoms cations

Contains empty electron orbitals \square as acceptors of electron pairs.

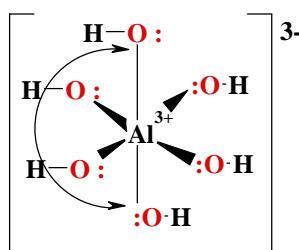

2. **Amino** complex ligands are electron pair donors $\text{H}_3\text{N}:\rightarrow\square$

3. **Acido** complex ligands are electron pair donors $\text{F}^-:$, $\text{Cl}^-:$, $\text{Br}^-:$, $\text{I}^-:$,

4. **Hydroxo** complex ligands are much stable lelectron pair donors to bind acceptor

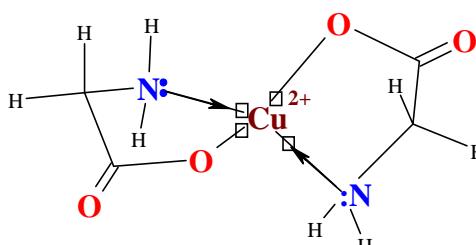

Hexa hydroxo aluminate(III) anion

5. **Polydentate ligands** of chelates, of internal complexes are most stable coordinative compounds in human organism as structural formations of proteins.

Designated in Biochemistry, Physiology about metal enzymes, metal proteins, for example,

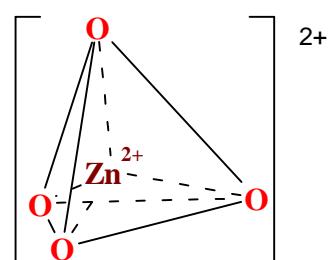

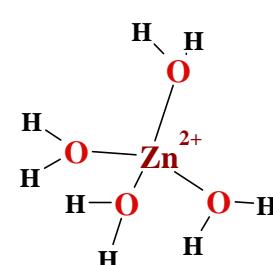

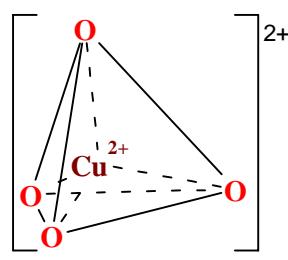

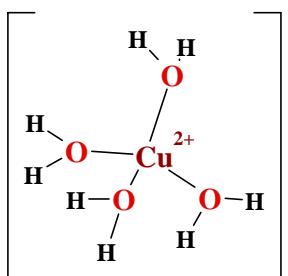

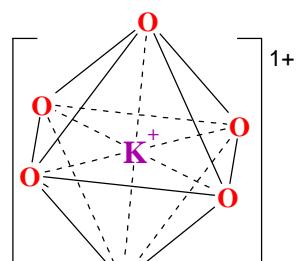

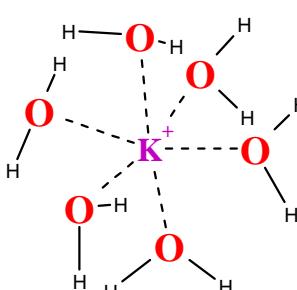

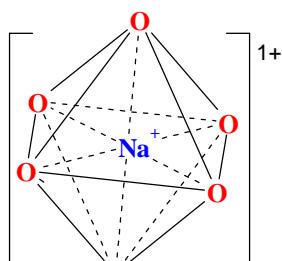

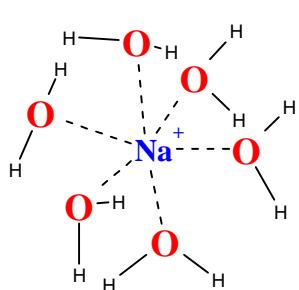

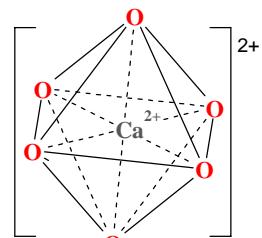

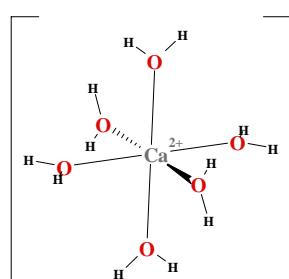

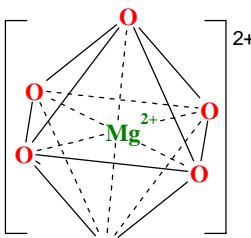

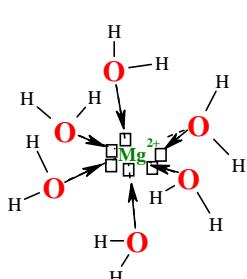

Amino acid glycine internal complex compound

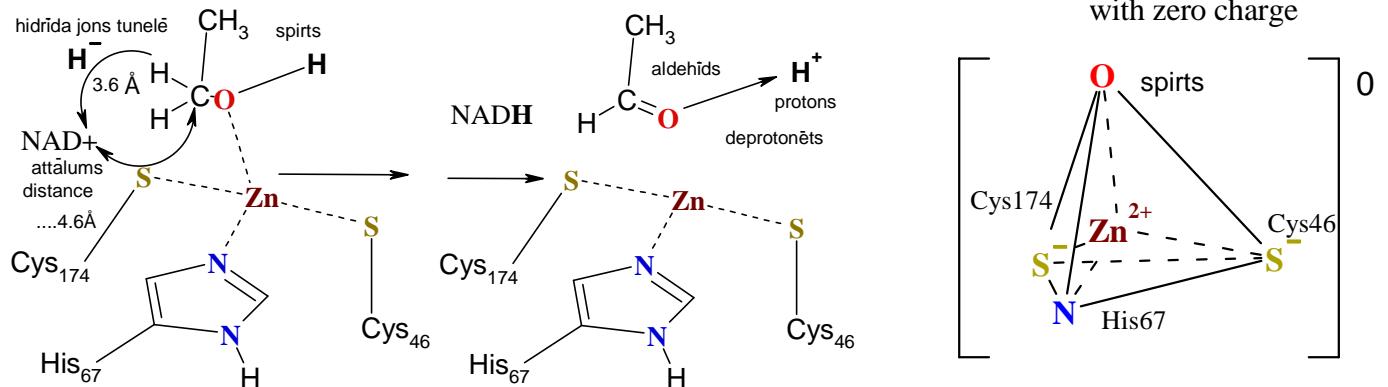

$[\text{Cu}(\text{NH}_2\text{CH}_2\text{COO})_2]$ di amino acetate cooper(II) complex.

Stability increase instant donor acceptor and covalent ionic bond with two glycine molecules and both molecules perpendicular planes.

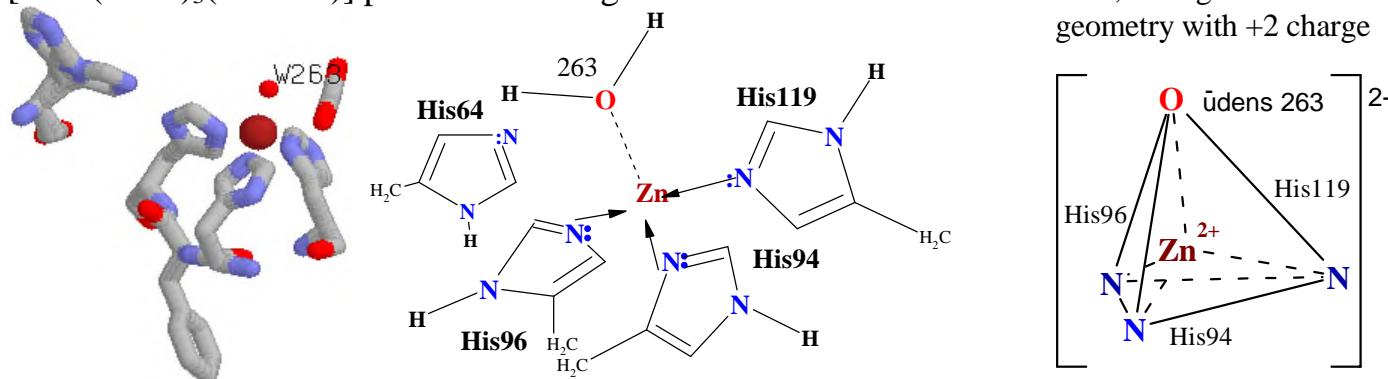

Metal ions Mg^{2+} , Ca^{2+} , Na^+ , K^+ , Cu^{2+} , Zn^{2+} central symmetry geometry in human organism aqua complexes

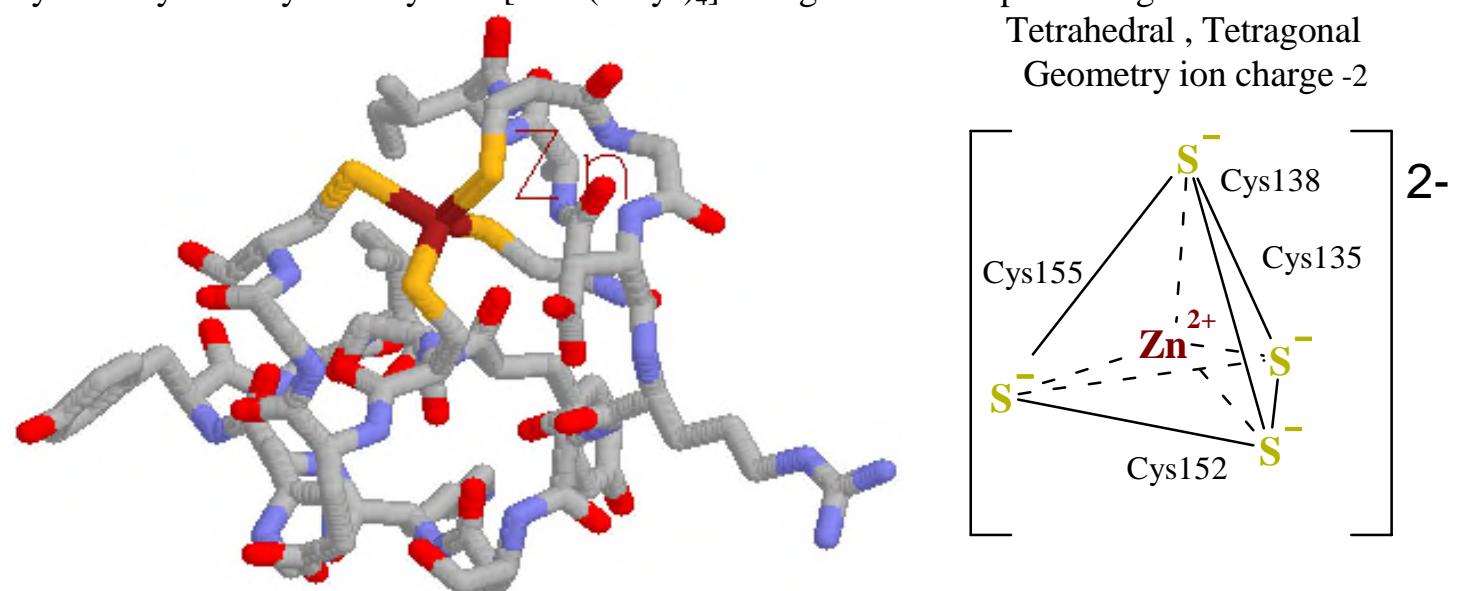

Alcohol dehydrogenase E.1 class enzyme 1HLD.pdb Zn^{2+} coordinates Cys46-Cys174-His67-alcohol: $[\text{Zn}^{2+}(\text{SCys})_2(\text{Oalcohol})(\text{NHis})]$ complex neutral zero charge . Tetrahedral , Tetragonal geometry with zero charge

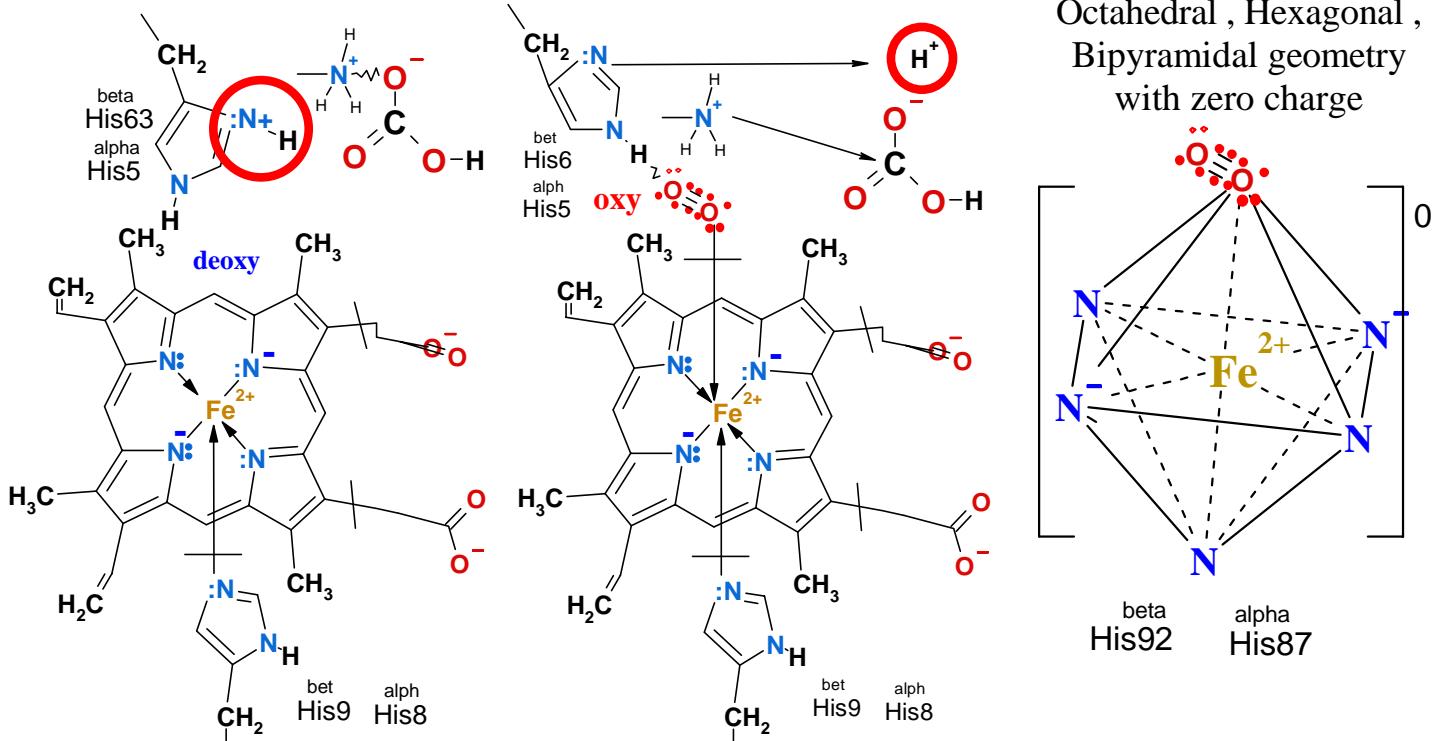

Carbonic anhydrase E.2 class enzyme 2VVA.pdb Zn^{2+} coordinates His96-His94-His119-water: $[\text{Zn}^{2+}(\text{NHis})_3(\text{Owater})]$ positive +2 charge.

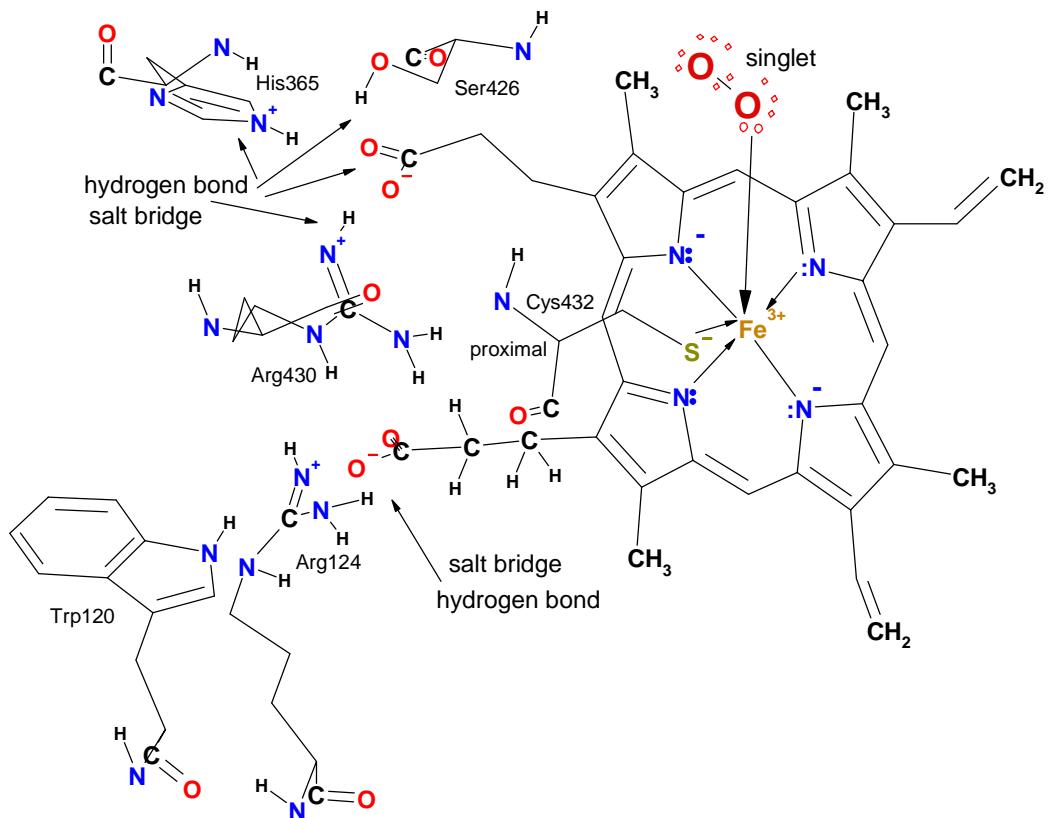

Zink finger motif DNA binding enzyme 3DZY.pdb Zn^{2+} coordinates Cys138-Cys135-Cys152-Cys155 $[\text{Zn}^{2+}(\text{SCys})_4]^{2-}$ negative -2 complex charge.

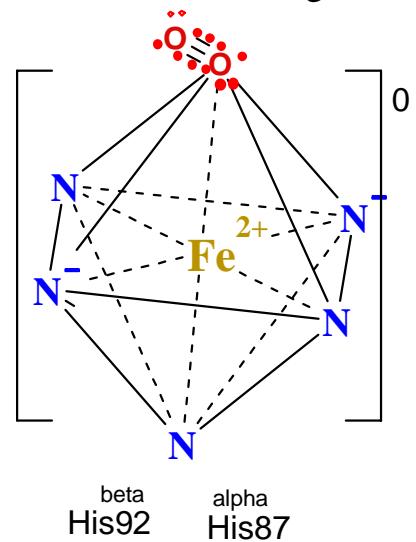

Shuttle hemoglobin deoxy-oxy Fe^{2+} coordinates hem $\text{N}^-\text{N}^-\text{N}^-\text{N}^-\text{NHis63,58}-\text{O}\equiv\text{O}$ triplet oxygen [$\text{Fe}^{2+}(\text{N hem})_4(\text{N His63,58})(\text{O}\equiv\text{O}$ triplet oxygen)]neutral zero 0 net charge of complex.0.

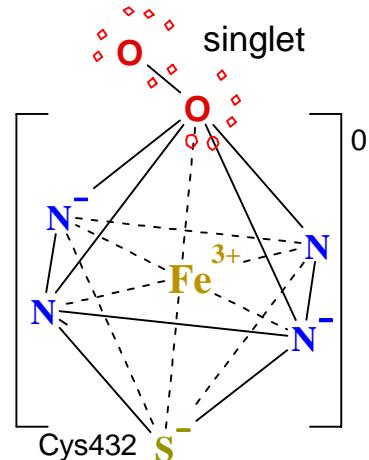

Cytochrome P450 Fe^{3+} coordinates hem $\text{N}^-\text{N}^-\text{N}^-\text{N}^-\text{S}^-\text{Cys432}-\text{O}-\text{O}$ singlet oxygen [$\text{Fe}^{3+}(\text{N hem})_4(\text{S}^-\text{Cys432})(\text{O}-\text{O}$ oxygen singlet)]neutral zero 0 net charge of complex..

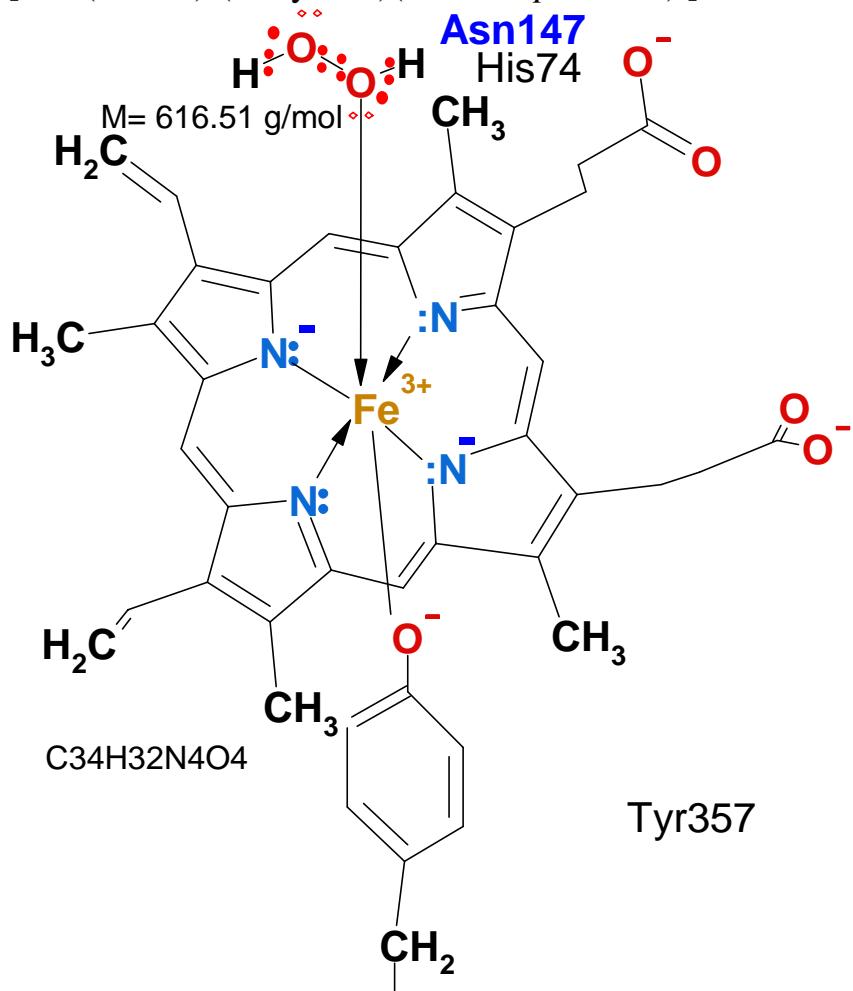

Octahedral , Hexagonal ,
Bipyramidal geometry
with zero charge

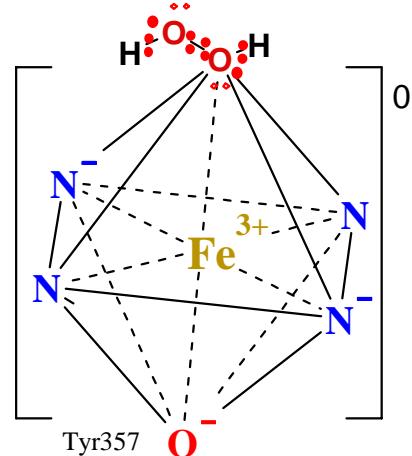

Octahedral , Hexagonal,
Bipyramidal geometry with
neutral charge zero:

Catalase (EC 1.11.1.6) Fe^{3+} coordinates hem N-N-N-N-O^- -Tyr357-HO-OH peroxide
 $[\text{Fe}^{3+}(\text{N hem})_4(\text{O}^- \text{Tyr357})(\text{HO-OH peroxide})]$ neutral zero 0 net charge of complex..

Hexagonal , Octahedral , Bipyramidal geometry:

Myosin contraction Ca^{2+} coordinates four glutamate $-\text{COO}^-$ carboxilate six oxygen atoms
 $[\text{Ca}^{2+} (\text{Glu-COO}^-)_4$ with 4 (Glu-O^-)₄ and two Glu-C=O] complex charge negative minus two 2- ...

Octahedral , Hexagonal , Bipyramidal geometry with minus -2 charge:
